## Total Solar Eclipse

### What's a Total Eclipse?

A total solar eclipse happens when the Moon completely covers the face of the Sun.

### Protect Your Eyes!

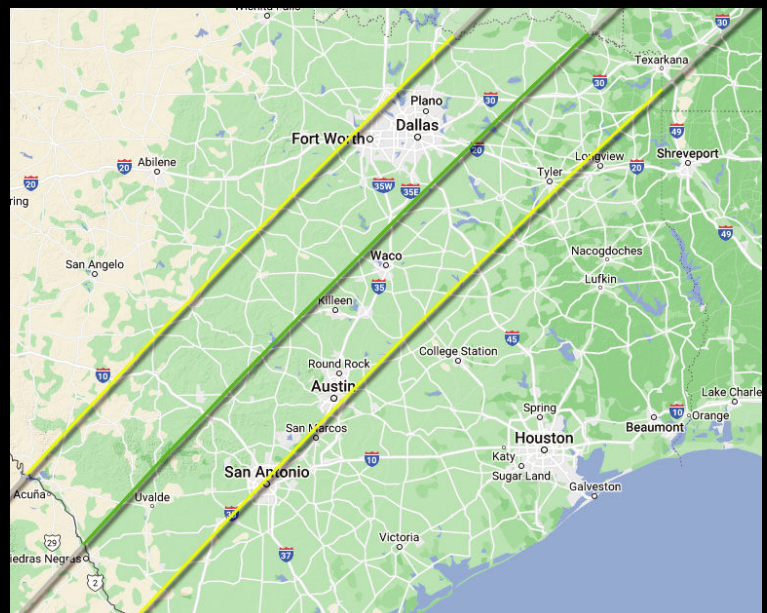

Never look directly at the Sun, eclipsed or otherwise, without proper protective eyewear. The Sun's radiation can burn your eye's retinas and cause permanent damage or even blindness. To safely watch a solar eclipse, wear protective eclipse glasses or project an image of the eclipsed Sun using a pinhole projector.

### Only Safe during Full Eclipse

It is safe to view a fully eclipsed Sun, totality, with the naked eye. It is also safe to observe totality through cameras, telescopes, or binoculars without any special filters. Do not look at the Sun with naked eyes unless the Moon blocks the entire Sun. Even a small amount of direct sunlight can damage your eyes. Make sure you know how long totality lasts in your location.
